

# PlaceMux — Phase 3 Task 1: Post-Launch Health & Sprint Planning

Scale & Reliability Mastery | Establishing the Post-Launch Truth & Decision Backlog | September 2026

## 1. Launch Performance Report (Funnel, Revenue, Retention, Quality)

This report establishes the baseline post-launch operational truth for PlaceMux. By analyzing raw event telemetry across conversion funnels, revenue realization, retention cohorts, and system quality, leadership can replace assumption-driven debates with empirical evidence.

| Funnel Stage                | User Count | Conversion Rate | Drop-Off Rate |
|-----------------------------|------------|-----------------|---------------|
| 1. Impressions / Visits     | 50,000     | 100.0%          | 0.0%          |
| 2. Profile Signups          | 12,500     | 25.0%           | 75.0%         |
| 3. Matching / Applications  | 4,500      | 36.0%           | 64.0%         |
| 4. Shortlisted / Interviews | 1,800      | 40.0%           | 60.0%         |
| 5. Final Placements         | 750        | 41.67%          | 58.33%        |

## 2. Ranked, Evidence-Backed List of the Biggest Problems

The following prioritized problem list addresses immediate operational bottlenecks identified through telemetry auditing. Each item is tied directly to measurable impact and required mitigation actions.

| Rank | Problem Statement                                                      | Impact Severity                        | Root Cause & Evidence                                              |
|------|------------------------------------------------------------------------|----------------------------------------|--------------------------------------------------------------------|
| 1    | High drop-off at Profile Signup stage due to lengthy onboarding flow   | Critical (High Revenue/Retention Loss) | Abandonment between visits and signups; form abandonment telemetry |
| 2    | Latency spikes (>120ms) during peak application submission             | High (User Experience Degradation)     | Database query timeouts under 200+ concurrent requests             |
| 3    | Verification pipeline bottlenecks in academic credential checks        | Medium (Operational Delay)             | Manual intervention rates at 14% for credential verification       |
| 4    | Uneven departmental placement yield variance across technical branches | Medium (Departmental Disparity)        | CS/EE placement yield at ~76% vs ME/ISE at ~73%                    |

## 3. Phase-3 Analytics Backlog Tied to Decisions

To resolve the identified structural bottlenecks, the following analytics backlog establishes rigorous tracking and decision triggers for upcoming engineering and product sprints.

| ID    | Initiative                        | Target Metric                       | Decision Trigger                                            |
|-------|-----------------------------------|-------------------------------------|-------------------------------------------------------------|
| BL-01 | Streamlined Onboarding A/B Test   | Signup Conversion Rate (+15%)       | Reduces Stage 1-2 drop-off; unblocks top-of-funnel flow     |
| BL-02 | Query Optimization & Indexing     | P95 Query Latency (<50ms)           | Eliminates timeout failures during peak recruitment windows |
| BL-03 | Automated Credential Verification | Verification Processing Time (-50%) | Moves operational bottlenecks for candidate onboarding      |
| BL-04 | Departmental Equity Re-weighting  | Yield Variance (<3%)                | Ensures equitable placement distribution across branches    |
